

Workload Management: How do I call Slurm utilities from nodes that run no slurmdbd?

On a node, some Slurm utilities such as `sacct` need to connect to the `slurmdbd` daemon. `slurmdbd` in turn talks to `mysql`. If the node is not running `slurmdbd`, then the node can be assigned to connect to `slurmdbd` by changing the line:

```
AccountingStorageHost=<DBHOST>
```

```
in /etc/slurm/slurm.conf.
```

Here, `<DBHOST>` is the hostname of a node where an appropriate `slurmdbd` daemon is running.
