

# Cluster Monitoring: How to collect metrics from older GPUs using NVML

The Bright 8.0 metrics system uses DCGM to collect metrics from GPUs. But DCGM doesn't support older GPUs.

Not to worry, you can still get the metrics from them using NVML using the old metrics collection script, which is still installed by default on Bright 8.0 clusters.

```
/cm/local/apps/cmd/scripts/metrics/sample_gpu
```

1. Add a new data producer, which is the old NVML metrics collection script.

```
[root@virgo-head ~]# cmlsh
[virgo-head]% monitoring
[virgo-head->monitoring]% setup
[virgo-head->monitoring->setup]% add collection sample-nvml-gpu
[virgo-head->monitoring->setup*[sample-nvml-gpu*]]% set script /cm/local/apps/cmd/scripts/metrics/sample_gpu
```

2. Add a new node execution filter. The data producer will only run on the nodes that have this "NVML" resource defined.

```
[virgo-head->monitoring->setup*[sample-nvml-gpu*]]% nodeexecutionfilters
[virgo-head->monitoring->setup*[sample-nvml-gpu*]->nodeexecutionfilters*]% add resource NVML
[virgo-head->monitoring->setup*[sample-nvml-gpu*]->nodeexecutionfilters*[NVML*]]% set resources NVML
[virgo-head->monitoring->setup*[sample-nvml-gpu*]->nodeexecutionfilters*[NVML*]]% commit
```

3. Add a userdefinedresource to the GPU node(s) you want the data producer to run on.

```
[virgo-head->monitoring->setup[sample-nvml-gpu]->nodeexecutionfilters[NVML]]% device use gpu01
[virgo-head->device[gpu01]]% append userdefinedresources NVML
[virgo-head->device*[gpu01*]]% commit
```

# Cluster Monitoring: How to collect metrics from older GPUs using NVML

4. Demonstrate that the metrics are now being collected (using NVML).

```
[virgo-head->device[gpu01]]% samplenow --metrics | grep gpu
